The Methylated cytosine DNA standard kit is a set of five DNA standards that are linear dsDNA, 426 bp, and have the same sequence (see sequence below & figure). The only difference is that each contains either normal cytosines, 5-methylcytosines, 5-hydroxymethylcytosines, 5-formylcytosines, or 5-carboxylcytosines. Since the sequence and extent of cytosine modification is known, this DNA standard set is ideal for use in calibration of various applications intended for quantitation of cytosine modifications.

Note: Sequence is same for all five standards. Depending on the DNA, all C's are unmodified cytosine, 5-methylcytosine, 5-hydroxymethylcytosine, 5-formylcytosine, or 5-carboxylcytosine.

Sequence statistics:

Summary

Nucleotide	Count	Frequency (%)
Adenine (A)	138	32.4 %
Thymine (T)	103	24.2 %
Cytosine (C)	88	20.7 %
Guanine (G)	97	22.8 %
C+G	185	43.4 %
A+T	241	56.6 %
