

SignalPlus Antibody Enhancer

Cat No. GTX49999
Application WB, Dot, ELISA

Reference (3)

Package

50 ml

PRODUCT
Summary

SignalPlus Antibody Enhancer for Western Blotting and ELISA enhances antigen-antibody reactions. SignalPlus Antibody Enhancer works well with chemiluminescence, colorimetric and fluorescence detection system. It can significantly enhance detection of weak immunoreactive and low abundance proteins in a variety of immunoassays such as Western blotting, dot blotting and ELISA. Simply dilute antibodies with SignalPlus Antibody Enhancer and process the rest of the procedures as usual. No additional steps are required. Signal enhancement is protein dependent and could vary from several folds to more than ten-fold.

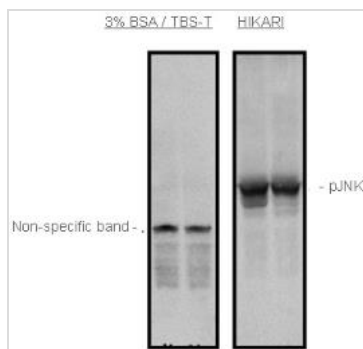

APPLICATION
Application Note

Dilute primary antibody in Solution 1 and secondary antibody in Solution 2. We recommend using a 10-fold lower working concentration of primary antibody than is usually required for western blot. Optimal working dilutions should be determined experimentally by the end user.

PROPERTIES
Form Liquid

Storage Store at 4°C.

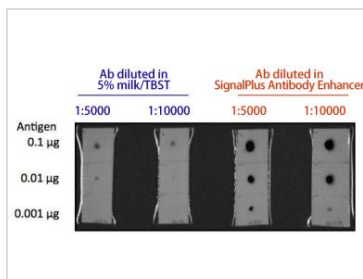

Note For laboratory use only. Not for any clinical, therapeutic, or diagnostic use in humans or animals. Not for animal or human consumption.

DATA IMAGES

GTX49999 WB Image

Detection enhancement of pJNK with treatment of Signal + in Western blot. Treatment with GTX49999 resulted in clear signal enhancement and background suppression compared with the conventional method using TBS-T. Primary Ab: Anti-pJNK (1: 1,000) Secondary Ab: Anti-rabbit IgG - HRP (1: 5,000) Sample: Mouse Embryonic Fibroblast (MEF) Detection: SuperSignal West Pico

For full product information, images and publications, please visit our [website](#).

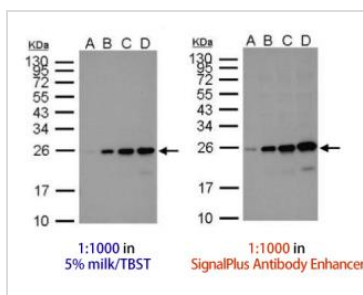

GTX49999 Dot Image

Antibody diluted in SignalPlus Antibody Enhancer solution can detect more than 100-fold lower levels of antigen than antibody diluted in standard buffers

GTX49999 WB Image

Detection enhancement of Rac1 with treatment of Signal + in Western blot. Treatment with GTX49999 resulted in clear signal, whereas dilution with conventional PBS-T resulted in no signal. Primary Ab: Anti-Rac1 (1: 1,000) Secondary Ab: Anti-Mouse IgG-HRP (1: 2,500) Sample: Rat cortical primary neuron
Detection: ECL

GTX49999 WB Image

Antibody diluted in SignalPlus Antibody Enhancer solution has superior signal to antibody diluted in standard buffers, even at a 10-fold lower concentration of antibody.
